

ModApps Dashboard Studio Client Guide

Installation, configuration and daily use for Odoo 19

Operational dashboards, guided queries and permission-aware sharing in one Odoo application.

Version 19.0.1.7.3 | OPL-1 | Introductory price USD 79

Support: info@modapps.dev | <https://modapps.dev/dashboard-studio.html>

Start here

This guide helps administrators install the module, designers build safe dashboards, and viewers understand results without bypassing Odoo security.

What the module does

ModApps Dashboard Studio builds operational dashboards from saved Odoo models and stored fields. A designer selects fields, calculations and typed conditions. The server validates the definition and evaluates every result under the current viewer's normal Odoo permissions.

Role	Main outcome
Administrator	Install, upgrade, assign roles and verify dependencies.
Designer	Create custom queries, widgets, filters and responsive layouts.
Viewer	Open shared dashboards, filter, inspect lineage, drill through and export.

The shortest path from a business question to a validated shared dashboard.

Key rule. Sharing a dashboard never grants access to underlying business records.

Roles and security

Choose the narrowest role each person needs. Dashboard access and business-record access remain separate.

Role	Can do	Cannot bypass
Insight Viewer	Open owned or shared dashboards; filter; inspect lineage; drill; export permitted data.	ACLs, record rules, field groups or company access.
Insight Designer	Includes Viewer; creates owned queries, dashboards, filters, widgets and layouts.	Business-record security or another owner's definitions.
Insight Manager	Includes Designer; governs definitions, templates and definition packages.	Business-data permissions, even during preview or export.

The server restores the saved definition and applies the current viewer's Odoo access context.

Security controls

- No user-authored SQL, Python, `safe_eval`, JavaScript or arbitrary domain execution.
- Results, previews, lineage, drill-through and exports enforce the current viewer's context.
- Short-lived cache entries are isolated by user, access context, companies, filters and definition revisions.

Install and upgrade

Use a staging database first. Replace the entire module directory during upgrades; never merge old and new files.

Compatibility

Item	Requirement
Odoo	19.0 Community or Enterprise
Hosting	Odoo.sh or self-hosted with custom add-on support
Odoo dependencies	base and web
Python dependency	xlsxwriter for XLSX exports
Not supported	Odoo Online databases that prohibit third-party add-ons

Installation steps

1. Back up the database and confirm `xlsxwriter` is installed in Odoo's Python environment.
2. Extract `modapps_insight_studio` into an add-ons directory and add it to `addons_path`.
3. Restart Odoo, enable developer mode and update the Apps list.
4. Search for ModApps Dashboard Studio and select Activate.
5. Assign Viewer, Designer or Manager to intended users, then sign out and back in.

Upgrade. Back up, replace the complete directory, restart Odoo, and upgrade `modapps_insight_studio` on a copy of production before the live database.

Dashboard library and starter templates

The dashboard library is the normal viewing entry point. Authorized users can open dashboards directly without entering the definition form.

Dashboard library

- The left catalog lists dashboards the current user may open.
- Open enters the live viewer; Arrange enables layout controls in the same viewer.
- The selected dashboard survives a normal page refresh through its durable URL identity.
- Sharing counts and widget counts help designers identify the correct definition.

Starter templates

Insight Managers can open Dashboard Studio > Configuration > Starter Templates. Six templates cover Sales, CRM, Purchase, Inventory, Invoicing and Project. A template appears only when its required app, model, fields and current manager permissions are compatible.

Start with a template when	Start empty when
The standard model and fields match the question.	The dashboard combines a specific internal process or custom model.
You want a quick reference layout to adapt.	You need deliberate measures, conditions and sharing from the start.

Build a Custom Query

Custom Queries are structured, validated ORM definitions. They are not free-form SQL editors.

1. From a dashboard select New Custom Query, or open Configuration > Custom Queries.
2. Choose an accessible source model, company scope, optional date field and a row limit from 1 to 200.
3. Add Selected fields one row at a time. Only stored, readable fields are offered.
4. Add Calculations with a business label and compatible aggregation.
5. Add typed Conditions one row at a time. The editor follows the selected field type.
6. Select Validate & Test and review the bounded fresh sample under your permissions.

Date grouping

Grouping	Typical use
Day	Daily operations and short response cycles
ISO week	Weekly workload or pipeline movement
Month	Sales, invoicing or stock trends
Quarter	Management review
Year	Long-range comparison

Monetary measures. The module rejects misleading aggregates when it cannot establish unambiguous currency semantics.

Choose and configure widgets

Widget fields change with the selected visualization. Measure and dimension choices are limited to the widget's Custom Query.

Widget	Required shape	Best use
KPI	One measure	Headline count, total or average
Gauge	Measure plus bounds	Progress against a defined range
Bar, line, area	Measure plus one dimension	Comparison or trend
Stacked bar	Measure plus two dimensions	Composition across categories
Pie, donut, funnel	Non-negative measure plus one dimension	Bounded share or stage view
Pivot	Measure plus two dimensions	Rectangular cross-tab analysis
Record list	Explicit readable columns	Actionable row-level detail

- Use clear business labels for every measure and dimension.
- Keep group limits readable; pie, donut and funnel cap at 20 groups.
- Record lists default to 25 rows and cap at 200.
- Select Preview Widget to run a fresh focused visual before saving.

Add useful filters

Filters should narrow a business question, not consume the dashboard. The viewer uses a compact toolbar and expands custom dates only when needed.

Filter type	Use it for
Date range	Quick periods or explicit From and To dates
Many2one	Customer, salesperson, product or another related record
Selection	Saved status or category choices
Boolean	Yes or no flags
Company	Narrowing a meaningful multi-company scope
Current user	My records or another saved user binding

Expected behavior

- A single allowed company is applied silently; the redundant selector is hidden.
- With multiple allowed companies, every allowed option starts visibly selected.
- Clear filters restores the safe saved scope.
- Invalid or unauthorized values are rejected on the server.
- Each filter targets only compatible widgets selected by the designer.

Design the live layout

Authorized designers can move, resize and edit cards directly from the dashboard viewer.

1. Open the dashboard and select Customize layout.
2. Drag a card header to move it; drag the lower-right handle to resize it.
3. Use keyboard controls on the move or resize handle for precise changes.
4. Select Edit on a card to change its settings, then preview with fresh data.
5. Select Save layout, or Cancel arranging to restore the saved layout.

Design guidance

- Place the most important KPIs first, then explanatory charts, then row-level tables.
- Use one accent family and avoid a different strong color for every card.
- Make tables wider than KPIs; keep KPI cards compact enough to scan together.
- Test the deterministic single-column mobile order before sharing.
- Resolve collision feedback instead of overlapping cards.

Unsaved work. Navigation and browser-unload warnings protect visible layout changes, but Save layout is still required.

Validate and share

Validation is a publishing gate. New sharing changes are blocked until the complete definition is internally consistent.

Before sharing

- Every dataset validates and returns an authorized bounded sample.
- Every widget has the fields required by its visualization type.
- Every filter targets compatible widgets and has a valid saved default.
- The 12-column layout contains every widget exactly once with no collision.
- Company scope is compatible across the dashboard and datasets.

Sharing workflow

1. Open Dashboard settings, then Access & Sharing.
2. Select intended users or groups; prefer maintained groups for teams.
3. Select Validate and resolve every blocking message.
4. Save the sharing change. The recipient finds the dashboard in the normal library.
5. Test once with a narrower Viewer account.

Different totals can be correct. Two viewers may see different values when their record rules, groups, companies or field access differ.

Explain numbers and drill through

Lineage answers why a value is shown. Drill-through opens only the source records behind the selected permitted segment.

Lineage includes

- Saved Custom Query and measure
- Dimensions and active runtime filters
- Company, timezone and currency context
- Fresh permitted source-record count
- Calculation time and cache state

Drill-through behavior

The browser does not construct a model, domain or order string. It identifies the saved widget and selected result segment. The server reconstructs the permitted segment from the validated definition and opens only records the current viewer may read.

When a drill is available	When it may be absent
A KPI or chart value maps to a saved result segment.	A pivot cell represents a missing combination displayed as zero.
The viewer can read matching source records.	The result state has no meaningful source segment.

Exports and presentation

Exports rerun saved queries under the exporting viewer. Rendered values and another user's cache are never export authority.

Output	Where	Behavior
CSV	Table or pivot widget	Fresh rows with spreadsheet-formula hardening
Widget XLSX	Table or pivot widget	Fresh bounded table data
Dashboard workbook	Dashboard toolbar	Fresh multi-sheet XLSX
PDF	Dashboard toolbar	Print-optimized browser Save as PDF flow
Full screen	Dashboard toolbar	Keeps current revision, filters and context

Presentation checks

- Confirm all widgets finished loading before exporting or printing.
- Review active filters and company context in the compact header.
- Use landscape orientation for wide tables when the browser print dialog offers it.
- Do not treat operational dashboards as authoritative statutory reports.

Troubleshooting

Preserve the dashboard definition and record the exact state message before changing configuration.

Symptom	Check
Menu missing	Module installed; at least Viewer role; sign out and back in after group changes.
Model or field missing	Designer can read it; field is stored; field group and company permit access.
Query fails validation	Field belongs to source model; operation matches type; currency is clear.
Template missing	Required app, model, fields and Manager permissions are available.
Cannot share	Validate datasets, widgets, filters, companies and complete layout.
Viewer sees fewer rows	Expected when ACLs, record rules, field groups or companies differ.
XLSX fails	xlsxwriter is installed in Odoo's Python environment; restart afterward.
Access denied after refresh	Dashboard company remains in the user's active allowed-company context.

Support request. Send the Odoo build, module version, dashboard and widget names, active company context, steps and traceback to info@modapps.dev. Remove credentials and sensitive business data.

Go live checklist and supported boundary

Use this final page before moving a dashboard from design into daily use.

Check	Done
Production backup and tested module upgrade	☐
Viewer, Designer and Manager roles assigned deliberately	☐
Queries validated with realistic permissions and company context	☐
Desktop and narrow-screen layout reviewed	☐
Narrow Viewer can open, filter, drill and export only permitted data	☐
Workbook and PDF-print output reviewed	☐
Support owner and escalation path recorded	☐

Release 1 boundary

Release 1 uses saved Odoo models and stored fields. It excludes external sources, ETL, data warehouses, arbitrary query text or executable code, write-back, scheduling, emailed reports, server-generated PDFs, public or portal dashboards, AI, forecasting, snapshots, definition rollback, custom chart plug-ins and authoritative accounting or statutory reporting.

License, price and support

The module is licensed under OPL-1. The introductory price is USD 79 one time and is intended to reduce adoption friction for early customers. Future pricing may change after real support and customer feedback. Support is available at info@modapps.dev.
